Shreya S Mattimadu

SE LAB2 LEVEL 2

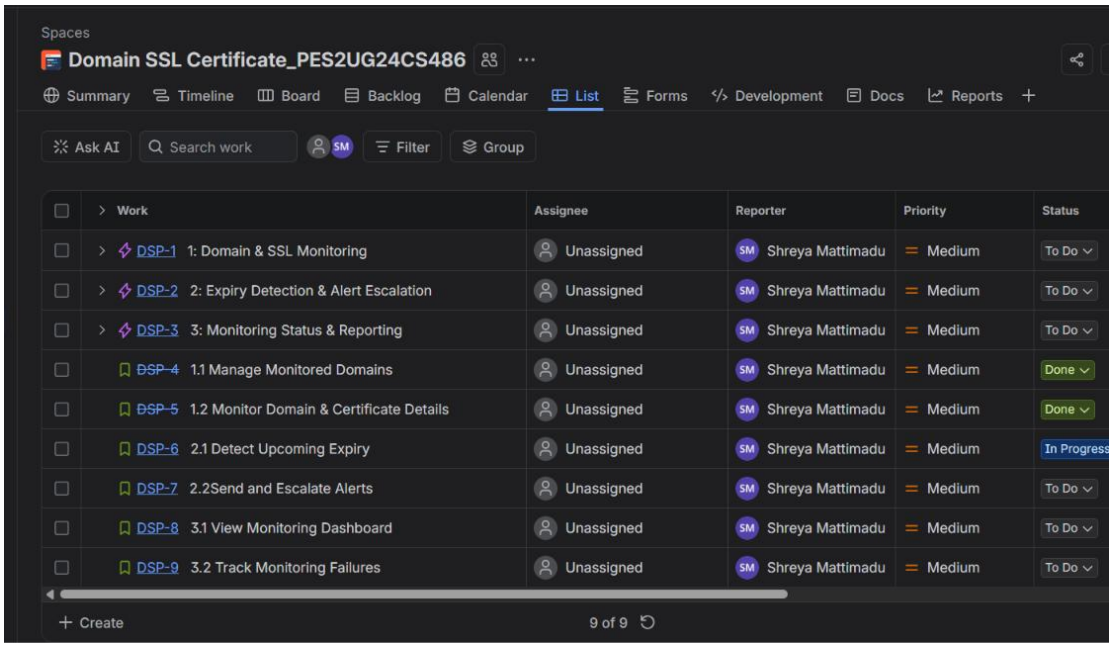

JIRA hands on assignment

Created EPIC 1,2,3 with two user stories

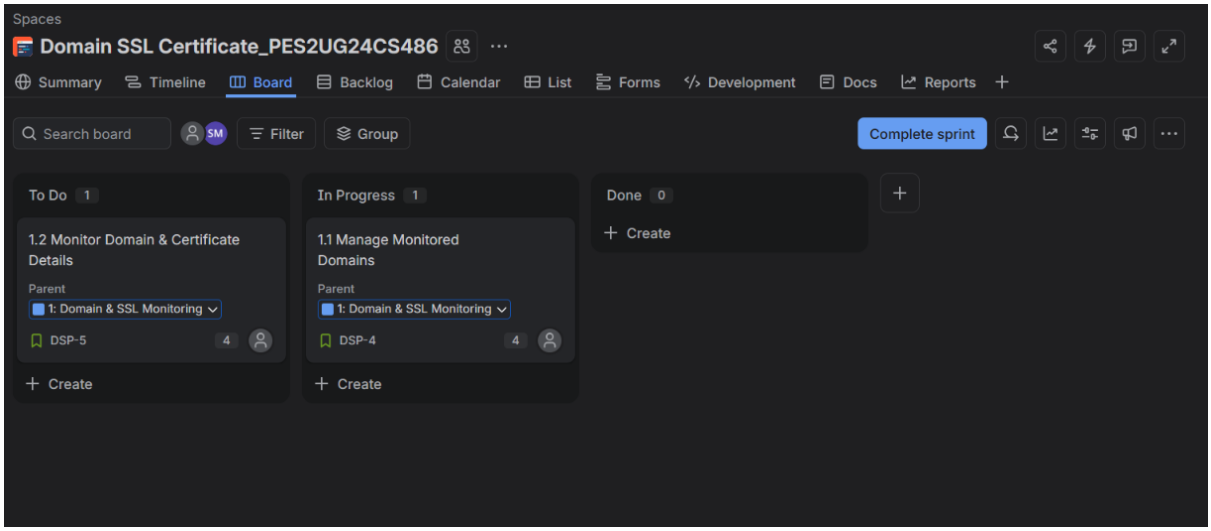

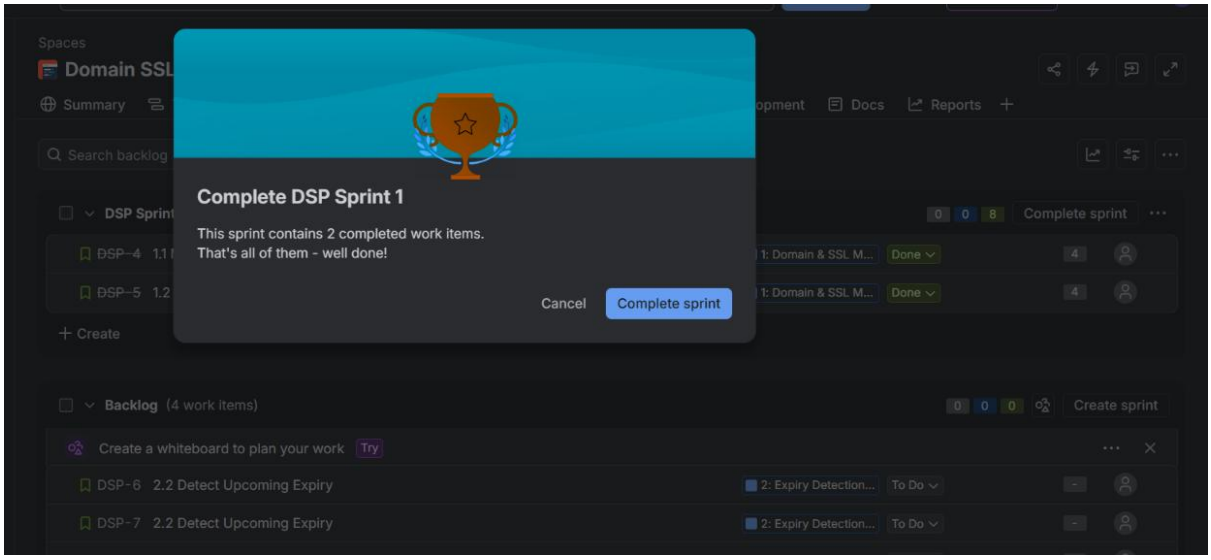

Similarly created 3 epics with 2 user stories for each

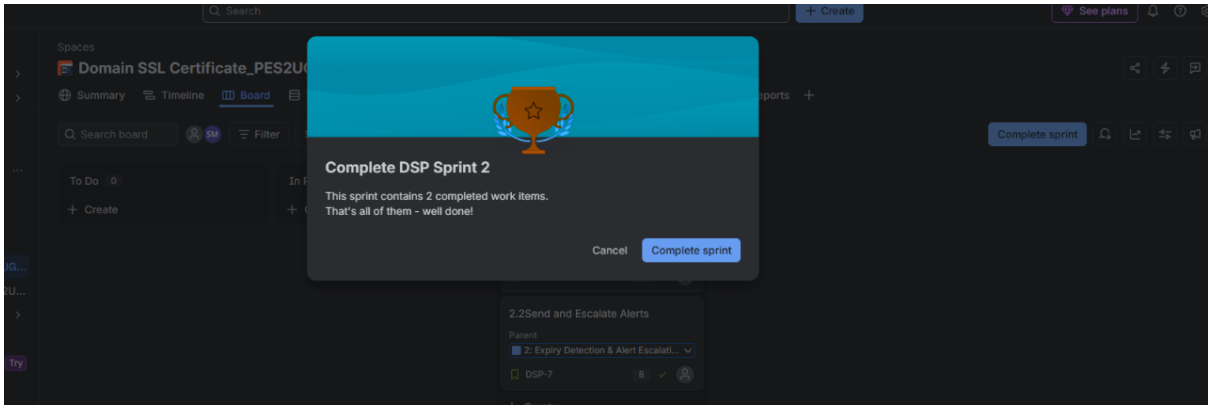

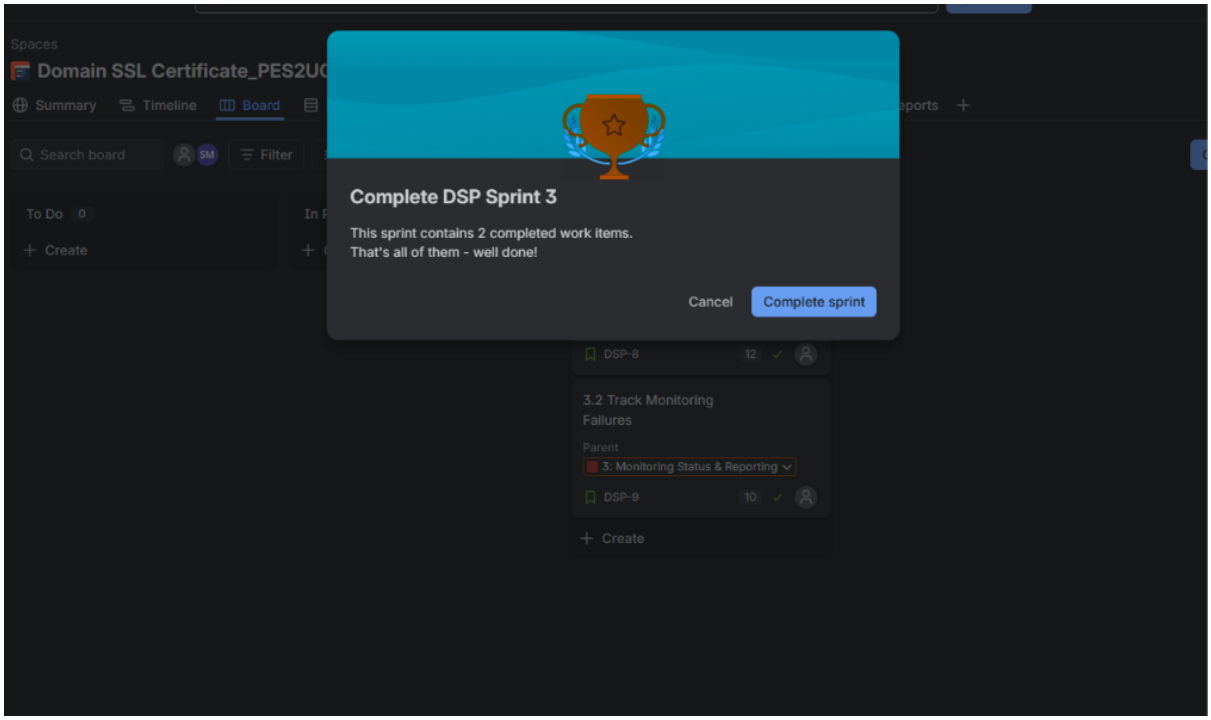

Created sprint and started the sprint

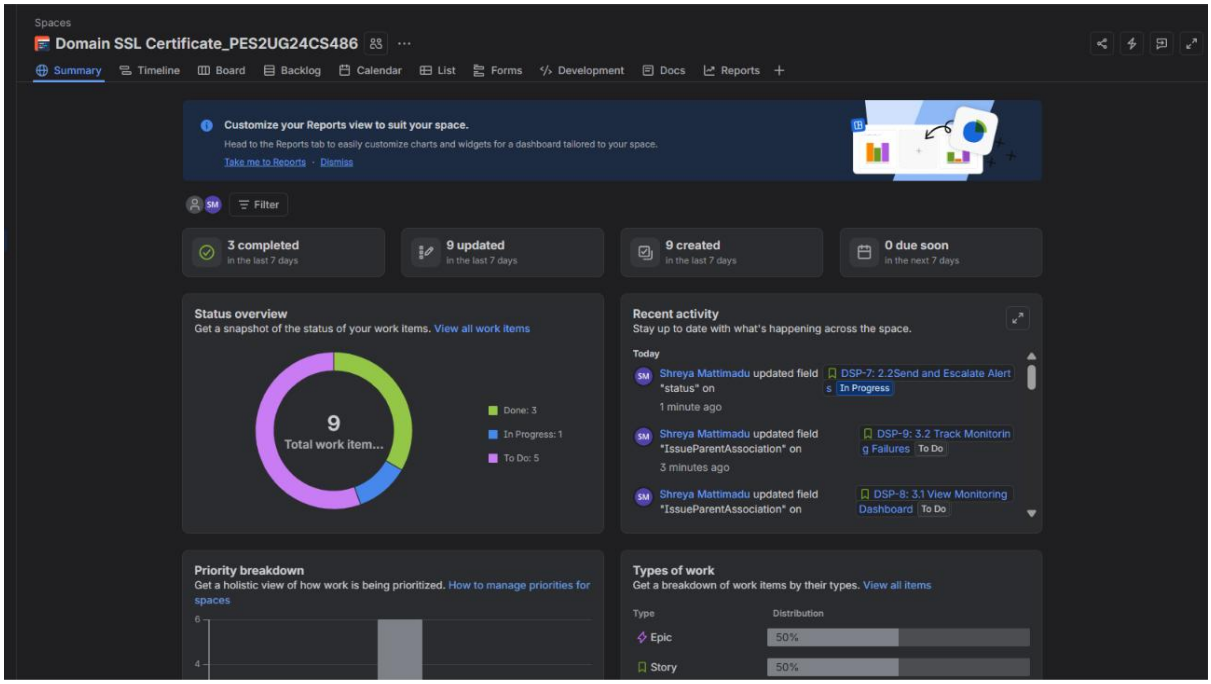

Creating multiple sprints and completing it

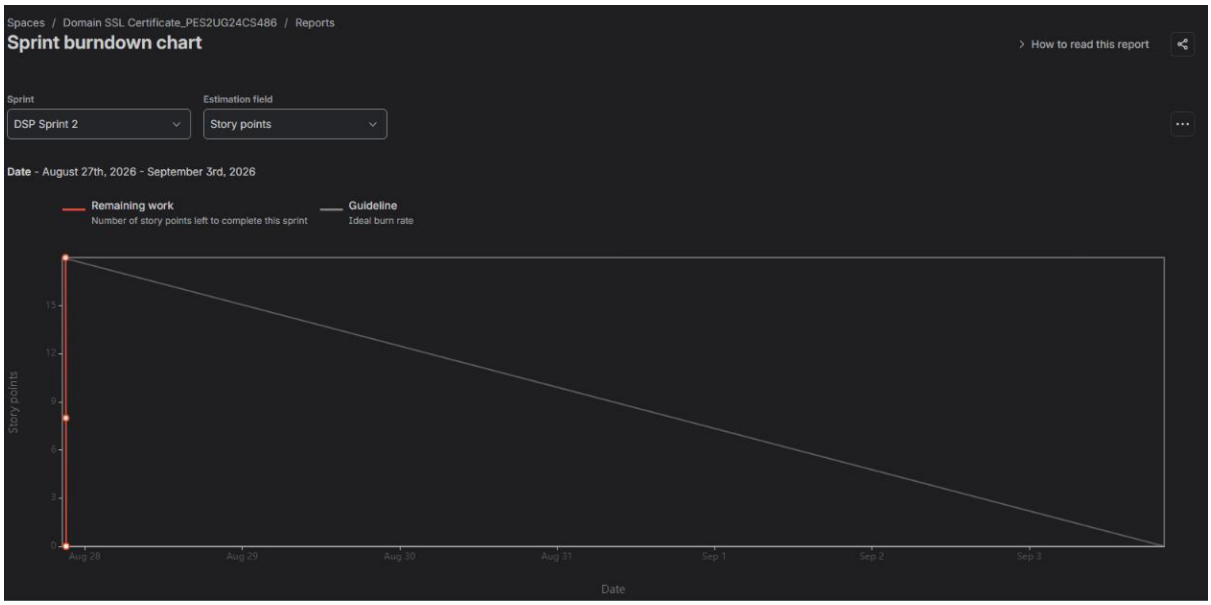

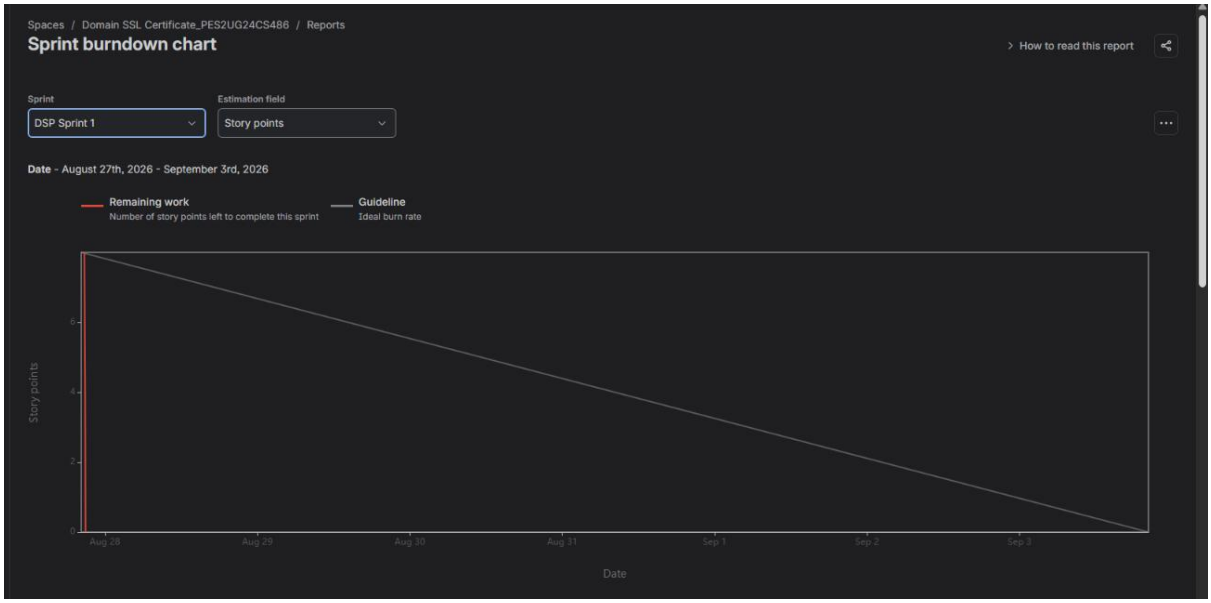

On going summary

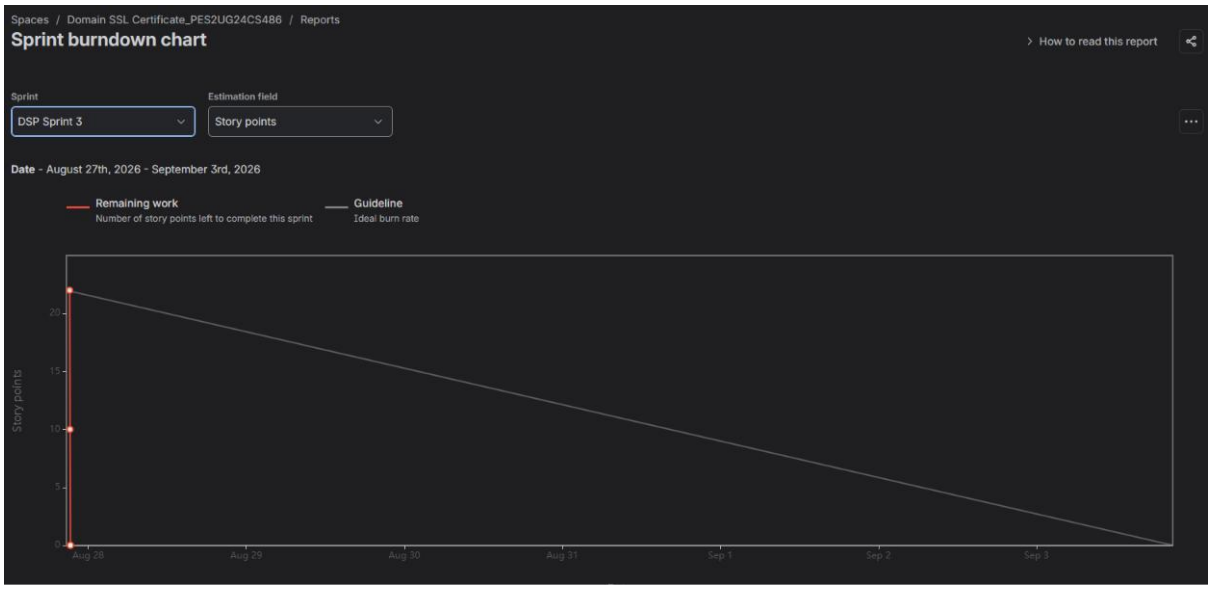

Sprint burndown chart

Sprint burndown charts here are slope as only 2 user stories per epic was created , leading to creation of only two tasks done in chart .. hence did not give the zigzag manner or down slope with dips and peaks in the chart .

Reflection Questions

1. Did your estimations reflect the actual effort?

Yes. The story point estimates represented the relative effort of the user stories. The sprint started with 8 story points, and the work was completed successfully, with the remaining effort reducing from 8 to 0.

2. Was your backlog well-prioritized?

Yes. The backlog was prioritized by implementing the core monitoring functionality first, followed by expiry detection and alert escalation, and finally monitoring status and

reporting. This allowed the fundamental features to be completed before the supporting features.

3. How did your simulated sprint align with your plan?

The simulated sprint followed the planned workflow. Two user stories were included in the sprint, and both were completed successfully. The sprint progressed from 8 remaining story points to 0, showing that all planned work was completed.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart showed that the team was able to complete all 8 story points planned for the sprint. The remaining work dropped from 8 to 4 and finally to 0, indicating that the planned workload was within the team's simulated capacity. Since the work was completed within a short period, it also suggests that future sprints could potentially handle a similar workload, though more realistic conclusions would require multiple sprints over longer durations.
